meaning

Booleans

Natural  
numbers

Conclusion

Appendix

## Introduction

- We can decide that some specific lambda terms have special meanings
- For example, we could decide that a given lambda term means TRUE, another FALSE, etc.
- The important thing is that we choose terms that behave as we wish

# Encoding boolean logic

Delta rules

boolean logic

Defining terms  
with special  
meaning

Booleans

Natural  
numbers

Conclusion

Appendix

## As we wish?

- Suppose we define some lambda terms for TRUE, FALSE, and AND
- We expect these terms to reduce<sup>a</sup> following our expectations of boolean logic
- We can use truth tables to encode our expectations

---

<sup>a</sup>That is, computed according to  $\rightarrow_\beta$

# Encoding boolean logic

Delta rules

The  
INFDEV@HR  
Team

Introduction

Encoding  
boolean logic

Defining terms  
with special  
meaning

Booleans

Natural  
numbers

Conclusion

Appendix

We want to formulate TRUE, FALSE, and AND so that

- $\text{TRUE} \wedge \text{TRUE} \rightarrow_{\beta} \text{TRUE}$
- $\text{TRUE} \wedge \text{FALSE} \rightarrow_{\beta} \text{FALSE}$
- $\text{FALSE} \wedge \text{TRUE} \rightarrow_{\beta} \text{FALSE}$
- $\text{FALSE} \wedge \text{FALSE} \rightarrow_{\beta} \text{FALSE}$

boolean logic

Defining terms  
with special  
meaning

Booleans

Natural  
numbers

Conclusion

Appendix

## Choice terms

- Terms with special meaning essentially make a choice when given parameters
- The choice is expressed by either returning, or applying, the parameters

# Defining terms with special meaning

INFDEV@HR  
Team

Introduction

Encoding  
boolean logic

Defining terms  
with special  
meaning

Booleans

Natural  
numbers

Conclusion

Appendix

## Delta rules

- We wish to use special symbols to these terms with special meaning
- We define a series of delta rules, which are transformation from pretty symbols into lambda terms (and vice-versa)

# Defining terms with special meaning

## Idea

- Boolean operators such as TRUE and FALSE must be defined so as to identify themselves
- The choice is expressed by returning their identity from a choice of two options

# Booleans

Delta rules

The  
INFDEV@HR  
Team

Introduction

Encoding  
boolean logic

Defining terms  
with special  
meaning

Booleans

Natural  
numbers

Conclusion

Appendix

TRUE is defined as a selector of the representative for true, that is the first argument<sup>a</sup>

---

<sup>a</sup>by arbitrary convention

$(\lambda t \ f \rightarrow t)$

FALSE is defined as a selector of the representative for false, that is the second argument<sup>a</sup>

---

<sup>a</sup>by arbitrary convention, as long as different from the previous

$(\lambda t \ f \rightarrow f)$

## AND

- The conjunction<sup>a</sup> of two terms is a function that takes as input two booleans and returns a boolean
- Since we just defined booleans to be two-parameter functions, we know that the two input booleans can be applied to each other
- Given two booleans  $p$  and  $q$ , their conjunction is  $q$  if  $p$  was true, or false otherwise

$$(\lambda p \ q \rightarrow ((p \ q) \ p))$$

---

<sup>a</sup>AND, or  $\wedge$

Conclusion

Appendix

## OR

- The disjunction<sup>a</sup> of two terms is a function that takes as input two booleans and returns a boolean
- Like with conjunction, remember that the two input booleans can be applied to one another
- Given two booleans  $p$  and  $q$ , their disjunction is true if  $p$  was true, or  $q$  otherwise

$$(\lambda p \ q \rightarrow ((p \ p) \ q))$$

---

<sup>a</sup>OR, or  $\vee$

## if-then-else

- The conditional operator if-then-else chooses one of two parameters based on the value of the input condition
- Given a boolean  $c$  and two values  $th$  and  $el$ , the result is  $th$  if  $c$  was true, or  $el$  otherwise
- Since  $c$  is a boolean, it already performs this choice!

## Idea

- Natural numbers such as 3 and 0 must be defined so as to identify themselves
- Their identity is determined by how many times they perform an action
- The only action we have available is applying a function to a term

Appendix

## Idea

- We will use unary numbers
- A number is defined by how many times it applies a function to a given term
- Zero applications are also possible, in this case we default to the given term

## Addition

- Adding numbers is a function that takes as input two numbers (say  $m$  and  $n$ ), and returns a number
- The first number applies its first parameter  $m$  times to its second parameter
- The second number applies its first parameter  $n$  times to its second parameter
- We can use the second number as the second parameter to the first, therefore obtaining something that applies  $m+n$  times

( $\lambda m \ n \rightarrow (\lambda s \ z \rightarrow ((m \ s) \ ((n \ s) \ z))))$

## Multiplication

- Multiplying numbers is a function that takes as input two numbers (say  $m$  and  $n$ ), and returns a number
- The first number applies its first parameter  $m$  times to its second parameter
- The second number applies its first parameter  $n$  times to its second parameter
- We can use the second number as the first parameter to the first, therefore obtaining something that applies  $n+m$  times, starting from  $z$

$$(\lambda m \ n \rightarrow (\lambda s \ z \rightarrow ((m \ (n \ s)) \ z)))$$

## Other arithmetic operators

- Division, subtraction, and all manners of comparison operators can be defined similarly
- The level of detail of the specification can be compared to that of a very high level CPU
- This means that we are, to an extent, programming in a sort of assembly
- This is the reason why the traces have been so verbose so far

Delta rules

Booleans

Natural  
numbers

Conclusion

Appendix

## Other arithmetic operators

- We could also define numbers in base two instead of base one
- This would save processing time, but would result in a slighter more complex specification
- We will just ignore these engineering details: we only focus on **what** can be done, not the best way to do it

## Recap

- Lambda terms can be used to encode arbitrary basic data types
- The terms are always lambda expression which, when they get parameters passed in, identify themselves somehow
- Identification can be done by applying something (possibly even a given number of times), or returning one of the parameters

# Conclusion

Natural  
numbers

Conclusion

Appendix

## Recap

- There are many encodings of data types, but they all behave in the same way by producing the same outputs for the same inputs
- From now on we will start ignoring the reduction steps for simple terms such as  $3+3$
- We will instead focus on more complex data structures, such as tuples, discriminated unions, and even lists
